

## 8. Quiz: Constructing Links

Friday, January 26, 2018 7:33 AM

### Hyperlinks

- You use ANCHOR ELEMENTS
- <https://developer.mozilla.org/en-US/docs/Web/HTML/Element/a>
  - o HTML <a> element (or anchor element) creates a hyperlink to other web pages, files, locations within the same page, email addresses, or any other URL

Inside the opening `a` tag there is `href`, which stands for "reference." This is called an attribute. Attributes like `href` describe the properties of HTML elements. In this case, the `href` attribute is the target URL that the link will open. The content inside the anchor element is the text that users see displayed on the page.

This is the format that you must use when you make hyperlinks! Note:

- There is a space between `a` and `href`.
- There are no spaces around the `=`.
- The website has two `"` around it.
- There are no spaces between the `href` attribute and the `>` of the opening tag.

=====

My answer, growing on last quiz

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <title>Tree to HTML</title>
  <!-- the next line loads the tests for the Udacity Feedback extension -->
  <meta name="udacity-grader" content="http://udacity.github.io/fend/fend-refresh/lesson2/problem-
set/tree-to-html/tests.json">
</head>
<body>
  <!-- Did you notice that the body tag - the top of the sample tree - is already here? You don't need to
add another one. -->
  <!-- Your code goes here! -->

  <h1>Tree grow in the ground</h1>
  <div>
    <p>
      <a href="https://www.google.com">GoogleSearchPage</a>
    <p>
  </body>
</html>
```
